May 2006

## Executive Summary

As part of the Southwest Florida Water Management District's (SWFWMD) approach for establishing minimum and guidance water levels for lakes, six significant change standards were developed as a means to evaluate significant harm to lakes. Two of the six standards are the Aesthetics Standard and the Recreation/Ski Standard. These standards are intended to determine at what lowered lake stage (water level), impacts may occur to either aesthetic and scenic values or recreational activities. However, setting standards was difficult because information was limited on what various lake-user groups perceived as preferable water level conditions for these activities. Thus, the current District Aesthetics Standard corresponds to the lake elevation that water levels are expected to equal or exceed $90 \%$ of the time on a long-term basis and the current Recreation/Ski Standard corresponds to recommendations of the United States Coast Guard for safe boating and water skiing. To ascertain if these standards should be changed or modified, the University of Florida designed a survey to determine a representative group of lake users perceptions regarding lake aesthetics, and recreational use in relation to lake stage.

A survey with 60 questions was developed with reviews and comments from SWFWMD staff. To insure a wide range of user groups was given the opportunity to participate, five mailing lists were obtained: Florida Boating Registrations, Florida Freshwater Fishing License Holders, Florida LAKEWATCH Volunteers, Florida Lake Management Society (FLMS) members, and Florida members of the North American Lake Management Society (NALMS). From those lists, random samples of individuals who reside within the boundaries of SWFWMD were sent the survey. There was a total of 2563 survey sent and of those 964 were filled out and returned yielding a return rate of $38 \%$.

Respondents who thought low water levels impaired aesthetic and recreational use of lakes can be separated into three general groups: 1) where respondents disliked exposed muck because of aesthetics, odor and access to a lake; 2) where respondents disliked vegetation (aquatic and terrestrial) that can expand during low water and limit lake visibility and/or access of a lake for recreation; and 3) where respondents disliked the physical limitation that low water puts on lake access and recreational activities.

When water levels were low enough to expose lake bottom (i.e., muck) the majority of respondents ( $60 \%$ to $71 \%$, depending on the individual question) thought that low water impaired the aesthetic and/or recreational use of the lake. Question 27 (support or oppose the Fish and Wildlife Conservation Commission's muck removal program for lakes) confirmed this finding with $74 \%$ of the respondents ( 695 individuals) supporting muck removal projects.

There were many questions in the survey related to aquatic plants, including emergent, floatingleafed, and submersed plants. Respondents generally thought plants are essential to the "health" of a lake and that aquatic plants are needed for fish and wildlife. Most respondents (709 individuals, $78 \%$ ) considered emergent and floating leaved plants to be wetland plants and $89 \%$ (826 individuals) supported preserving wetlands. Respondents generally found no problem with emergent plants growing out to 50 feet from shore and they wished to maintain the current status of aquatic vegetation in their lake. However, when terrestrial, or aquatic plants (all types) extended past 50 feet from shore or if they interfered with recreation respondents considered this
an impairment of aesthetics and/or recreational use of the lake. Supporting this finding, $79 \%$ of the survey respondents ( 735 individuals) supported some type of management of all types of shoreline vegetation (terrestrial and aquatic). Thus, any water level that supports the expansion of vegetation would be considered an impairment of the aesthetics and/or recreational use of a lake, despite respondent's desire to preserve wetlands.

There were also many questions in the survey that asked the respondents about water level in relation to the physical access to the lake for aesthetic and/or recreational activities on a lake. Survey returns indicated respondents were not that concerned about high water conditions unless the water flooded lawns and/or trees for an extended period. The majority of respondents ( $>$ $60 \%$ ) were willing to accept a "high" water level where levels are at a stage equal to or less than levels that occur $80 \%$ to $90 \%$ of the time during a 2 -year, 1 -year or 3-month flood event because these levels generally do not flood property. Respondents ( $55 \%$ to $78 \%$, depending on the question) felt that any low water situation that limits access to a lake impairs aesthetic and/or recreational use. However, for natural drought situations the majority of the respondents were willing to accept a low water level where level are at a stage equal to or less than $20 \%$ to $30 \%$ of the time during a 2 -year, 1 -year and a three-month drought event. When asked specifically what water level impaired aesthetic and/or recreational use the majority of respondents selected a low water level where level are at a stage equal to or less than $30 \%$ to $40 \%$ of the time. When asked what long-term water level they most preferred $91 \%$ of the respondent ( 854 individuals) preferred some water level above the long-term median.

While people accepted the concept that some water level fluctuation is good for fish and wildlife in a lake, $60 \%$ of respondents ( 571 individuals) preferred a fluctuation pattern that incorporated a moderate increase or decrease during the year. Survey respondents understand that natural (403 individuals, $43 \%$ ), or both natural and man caused factors ( 372 individuals, $39 \%$ ) are the primary cause of water level fluctuation in their lake. Over half of the respondents ( 505 individuals, 54\%) however, felt that governmental agencies should manage water levels but just enough to minimize flooding and to prevent low water periods.

Thus, results from the Lake User Survey suggest that lake users are willing to accept water level fluctuations where water levels are at a stage that occur equal to or less than $20 \%$ of the time up to a stage that occurs equal to or less than $90 \%$ of the time. Outside of this range lake users feel that lake aesthetic and/or recreational use are impaired. However, most survey respondents preferred a moderate fluctuation pattern where water levels are at a stage that occur equal to or less than $50 \%$ of the time up to a stage that occurs equal to or less than $80 \%$ of the time

Question 1 Have you lived at or visited a lake during the past year? ..... 9
Question 2 What is the name of the lake you live on or visit? ..... 10
Question 3 Give the lake named in Q2, how beautiful would you rate it? ..... 19
Question 4 How many years have you lived at or visited this lake? ..... 20
Question 5 How often have you done the following lake-related activities during the last year? ..... 21
Question 6 Were there any days during the last year when you wanted to use the lake but could not because of high water level? ..... 34
Question 7 What did you do when high water level prevented you from using the lake? ..... 35
Question 8 Were there any days during the last year when you wanted to use the lake but could not because of low water level? ..... 36
Question 9 What did you do when low water level prevented you from using the lake? ..... 37
Question 10 Thinking back to 2000 when Florida had a sever drought, were there any days during the last year when you wanted to use the lake but could not because of low water level? ..... 38
Question 11 What did you do in 2000 when low water level prevented you from using the lake? ..... 39
Question 12 How important is the water level in determining the beauty or attractiveness of alake?40
Question 13 Which one of the following is most important in determining the beauty of a lake? ..... 41

## Question 14 Which one of the following do you most often judge the water level on lakes?

$\qquad$
Question 15 What water level do you feel decreases the scenic value of your lake?43
Question 16 What is the shape of the lake you live at or visit most? ..... 44
Question 17 Keeping in mind the shape of your lake, what is the long term water level that you prefer most? ..... 45
Question 18 What is the lowest long-term water level at which the lake's scenic beauty is harmed? ..... 45
Question 19 What is the lowest long-term water level at which the lake's recreational use is harmed? ..... 45
Question 20 What is your opinion on water levels during droughts and floods? ..... 49
Question 21 Which water level pattern do you prefer on a lake? ..... 57
Question 22 What, in your opinion, is the cause of fluctuating water levels on the lake that
you live on or have visited? ..... 58
Question 23 Do you think that governmental agencies should or should not manage the waterlevels on lakes?59

Question 24 Pumping ground water can lower water levels in lakes. Given this background, please answer the following questions.60

Question 25 Suppose the lake bottom were exposed by drought. Would you support or oppose an additional amount being exposed by people pumping nearby well-water?$-64$

Question 26 If raising and lowering lake water to a level determined by professionals was possible at the lake where you live or visit, would you support or oppose their recommendation?66

Question 27 Do you support or oppose the Fish and Wildlife Conservation Commission's muck removal program for lakes?67

Question 28 If you have a concern about the water level in your favorite lake, who would you contact? 68

Question 29 Please rate how much you like or dislike the following conditions for lakes.-- 69

Question 30 Please indicate your agreement or disagreement with the following statements.
$\qquad$
Question 31 Are you aware that there is an aesthetic standard for the water level in Florida's lakes?

Question 32 Please indicate your agreement or disagreement with the following statements about recreation.

Question 33 Please answer the following questions about access to docks and boat ramps.

Question 34 Are you aware that there is a recreational standard for the water level in Florida's lakes?109

Question 35 Do you think emergent plants (e.g., Cattails) and floating plants (e.g., Lilly pads) are wetland vegetation? --------------------------------------------------------------------------------------110

Question 36 Do you support or oppose preserving wetlands? 111

Question 37 Do you support or oppose managing aquatic plants along the shoreline of lakes?
$\qquad$
Question 38 Of the following which do you consider to be good for a lake?---------------- 113
Question 39 If low water resulted in an increase in underwater plants that limit your access to open water boating, would you consider this impaired aesthetics or recreation? ----------- 114

Question 40 Does it matter to you whether an underwater plant is a native to Florida or introduced from outside the state?

Question 41 If Hydrilla (an invasive plant introduced into Florida) was ranked by biologists as the best underwater plant for fish and wildlife would you accept this plant in your lake?

Question 42 If water was high enough to allow fish to survive and attract large numbers of wading birds, but not to support fishing on the lake would this be acceptable?

Question 43 If low water would benefit a single endangered species at the expense of other plant and animals, would you support or oppose lower water levels?

Question 45 Do you own or rent property on a lake? 119
Question 46 How many feet of lakeshore frontage do you have? ..... 119
Question 47 Of the lakeshore frontage, how many feet of vegetation have been cleared or mowed? ..... 119
Question 48 Do you have a dock? ..... 120
Question 49 If Yes, how deep is the water at the end of dock currently? ..... 120
Question 50 Do you have a boat ramp or access to one on your lake? ..... 121
Question 51 If Yes, has it ever been unusable because of low water? ..... 122
Question 52 Do you have a boat? ..... 123
Question 53 If Yes, how many feet of water do you need to operate your boat? ..... 123
Question 54 How many days did you use your boat on a lake during the last month? ..... 123
Question 55 How many people, including yourself, usually ride in the boat? ..... 124
Question 56 What year were you born? ..... 124
Question 57 What is your gender? ..... 125
Question 58 Are you Hispanic or Latino? ..... 125
Question 59 What is your race? ..... 125
Question 60 Do you work for pay? ..... 125
Question 61 How many children or grandchildren live in your home and/or visit your home?125

## Introduction

Scientists participating in an international workshop on shallow lakes systems suggested that water level fluctuation is the overriding effect on the ecology, functioning and management of shallow lakes (Coops et al. 2003). There are many mechanisms like nutrient loading, color, flushing rate, biotic interactions, aquatic plant abundance and others that are related to water levels changes in a lake that may impact the lake's characteristics (Dillon 1975; Gasith and Hoyer 1992; Brown et al. 2000; Nagid et al. 2001; Havens et al. 2004; Hoyer et al. 2005). These and other process have been used by the Southwest Florida Water Management District (SWFWMD) to establish minimum and guidance levels for lakes because the District is mandated to establish minimum and guidance levels for lakes and to identify water elevations below which significant harm to lake structure and function could occur.

As part of the District's approach for establishing minimum and guidance levels for lakes, six significant change standards were developed as a means to evaluate significant harm to lakes. Two of the six standards are the Aesthetics Standard and the Recreation/Ski Standard. These standards are intended to determine at what lowered lake stage, impacts to aesthetic and scenic values and recreational activities may occur. Although it was the intent of the District to incorporate the findings of previous lake user group studies in the development of these standards, it was found that this information was limited. As a result, the Aesthetics Standard currently corresponds to the elevation that a lake's water levels are expected to equal or exceed ninety percent of the time on a long-term basis. While this elevation may be appropriate to preserve use, the District recognizes that development of the standard may be improved.

Similarly, the Recreation/Ski Standard was developed to take into consideration recreational activities including, boating, swimming, fishing, and water skiing in relation to lake stage change. Again, because information is limited on what various user groups perceive as preferable lake conditions for these activities, the Recreation/Ski Standard currently corresponds to recommendations of the United States Coast Guard for safe boating and water skiing. Additionally, changes in the coverage of herbaceous wetland and submersed/floating vegetation are also evaluated in relation to changes in lake stage, but information is needed on how increases or decreases in the percentages of plant cover may affect the aesthetic values and recreational activities of lake users. Thus, the objective of this study was to conduct a lake user survey to determine user perceptions regarding lake aesthetics, recreation, and coverage of aquatic vegetation in relation to lake stage. Through the use of lake user perceptions the development of the Aesthetics and Recreation/Ski Standards may be more quantitatively supported and refined to better reflect their intent.

## Methods

To determine lake user perceptions about lake conditions in relation to lake water levels, a survey with 60 questions was developed with reviews and comments from SWFWMD staff (Appendix I, notice that there is no Question 44 due to a numbering error when the survey was printed). To insure a wide range of user groups was given the opportunity to participate, the following five mailing lists were obtained: Boating Registrations, Freshwater Fishing License Holders, Florida LAKEWATCH Volunteers, Florida Lake Management Society Members, and

North American Lake management Society members. From those lists, random samples of individuals who reside within the boundaries of SWFWMD were sent the survey.

To insure the highest level of survey returns the following procedure was used for sending the surveys. In October of 2006, an introductory letter describing the survey's intent was sent to all individuals, informing them that a survey would be arriving soon. Approximately seven to 10 day after the introductory letter was sent, the survey was mailed with a self-addressed, postage applied envelope for returning the survey. Two weeks later, a post card was sent to individuals who had not yet returned the survey asking them to please return the survey. Finally, after another two weeks, for those who had not yet returned a survey another survey was mailed.

Upon receiving returned surveys all responses were computerized and proofed using Access. Summary tables were generated using SAS. The summaries are cross tables reporting the numbers and percentages of responses to each question listed by user groups and with a total of all responses. The number of responses for the FLMS and NALMS user groups were small and because they are both similar professional societies they were combined in all cross tables.

## Results

There was a total of 2563 survey sent and of those 964 were filled out and returned yielding a return rate of $38 \%$ (Table 1). The lowest percentage of returned surveys was for the fishing license holders with only $21 \%$ returns. The highest percentage of returned surveys was for LAKEWATCH volunteers with $58 \%$.

Table 1. Number of surveys sent, returned and percentage of surveys returned listed by user group.

| Group | Survey Sent | Surveys <br> Returned | Percent <br> Returned |
| :--- | :---: | :---: | :---: |
| Boat Registrations | 800 |  |  |
| Fishing Licenses | 800 | 255 | 32 |
| FLMS | 106 | 169 | 21 |
| NALMS | 30 | 45 | 42 |
| LAKEWATCH | 827 | 16 | 53 |
|  |  | 479 | 58 |
| Total | 2563 | 964 | 38 |

The following results sections will be presented by question number with discussions where needed. The cross tables are labeled with the survey question number and all set up the same, with the number of individual responses the top number in a cell and the percentage of responses the bottom number. The Cross Tables were also separated by user group so that the reader could determine if there were any large differences in responses based on different user groups. However, the vast majority of responses for each user group were similar for each question.

Question 1 responses show that a total of $94 \%$ individuals responding lived on or visited a lake within the last year. Individuals did not answer question 1 in 12 surveys. All individual groups had similar responses suggesting that the individuals responding to the survey were indeed familiar with the lakes that they were using to respond to the survey questions.

| Table of Q1 by Group |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Q1. (1 Have you lived at or visited a lake during the past year?) | Group |  |  |  | Total |
|  | Boat license list | Fishing license list | LAKEWATCH list | NALMS \& FLMS list |  |
| No | $\begin{gathered} 26 \\ 10.32 \end{gathered}$ | 16 9.52 | 11 2.34 | 1 1.64 | 54 6 |
| Yes | 226 89.68 | 152 90.48 | $\begin{gathered} 460 \\ 97.66 \end{gathered}$ | $\begin{gathered} 60 \\ 98.36 \end{gathered}$ | 898 94 |
| Total | 252 | 168 | 471 | 61 | 952 |
| Frequency Missing $=12$ |  |  |  |  |  |

Question 2 asked the name of the lake the respondent lived on or visited in the last year. Fifty responses listed no name but the following is a list of 340 lakes that were listed with the number of responses for each lake. This is a large number of lakes and gives a good distribution of lake types for the survey responses.

Question 3 asked the respondents to rate the beauty of the lake they named. The majority of responses ( $77 \%$ ) from all user groups thought that the lake in question was either moderately beautiful ( 350 individuals, $38 \%$ ) or very beautiful ( 364 individuals, $39 \%$ ). These data suggest that most people are generally pleased with the beauty of their lake or the lakes that they visit.

Question 4 asked the respondent to list the number of years they visited or lived on the lake named in question 2. The distribution analysis below shows that the respondents lived or visited the named lake for a median of 11 year with a wide range of 0 to 69 years. Seventy five percent of the respondents lived or visited the named lake for six or more years. These data suggest that most of the individuals answering the survey have several years of lake observation for experience.

| Quantiles |  | Years Lived on <br> Lake |
| :--- | :--- | :---: |
| $100.0 \%$ | maximum | 69 |
| $99.5 \%$ |  | 60 |
| $97.5 \%$ |  | 47 |
| $90.0 \%$ |  | 33 |
| $75.0 \%$ | quartile | 21 |
| $50.0 \%$ | median | 11 |
| $25.0 \%$ | quartile | 6 |
| $10.0 \%$ |  | 3 |
| $2.5 \%$ |  | 1 |
| $0.5 \%$ |  | 0 |
| $0.0 \%$ | minimum | 0 |

Question 5 asked the Lake User Survey respondents to rank the amount of time they spend at a list of 12 different lake user activities. All activities were conducted by at least some of the respondents. However, Figure 1 shows that sailing and jet skiing are the two activities done least while fishing and sitting to enjoy the lake are the activities done most often.

Figure 1. Summary of the percentage of time survey respondents use lakes for a list of 12 different lake use activities.

The cross tables below show the frequency of responses to each individual activity (Question 5a through 5L) by user group. For each activity the frequency of use is similar among all user groups.

Question 6 asked the survey respondents if there were any days in the last year when they could not use a lake because of high water. Only six percent ( 55 individuals) of the respondents answered yes to question 6 . This suggests that generally high water is not an issue for recreational use of lakes. Some of the respondents could not use a lake in each one of the preceding months (Table 2) but the highest problems were in August 2005 and October 2004 with 20 individuals not able to use a lake. For those that could not use a lake, $78 \%$ said they just did something else with their time (Question 7 Cross Table below).

Question 8 asked the respondents if there were any days in the last year when they could not use a lake because of low water. Only 4 percent ( 37 individuals) of the respondents answered yes to question 8 . Similar to question 6 about high water, this suggests that generally low water is not an issue for recreational use of lakes. Some of the respondents could not use a lake in each one of the preceding months (Table 3) but the highest problems were in June 2005 and July 2004 with 11 individuals not able to use a lake. For those that could not use a lake, $61 \%$ said they just did something else with their time (Question 9, Cross Table below).

Question 10 asked specifically about the sever drought in 2000 and whether the survey respondents had trouble using a lake because of low water. Approximately half of the respondents (463 individuals) said yes that during the extreme drought of 2000 they had a difficult time using a lake. The majority of those individuals (55\%) said they did something different with their time (Question 11 Cross Table below).

Question 12 asked the respondents how important lake water level is in determining the beauty of a lake. A strong majority of the respondents thought that water level was extremely important (283 individuals, $30 \%$ ) or very important ( 332 individuals, $35 \%$ ) in determining the beauty of a lake. Only a small portion of the respondents thought that lake level was only slightly important (72 individuals) or not at all important (40 individuals).

Question 13 asked which of five options is the most important in determining the beauty of a lake. Even though Question 12 suggested that many individuals thought that water level was extremely important in determining the beauty of a lake only $15 \%$ of the respondent (143 individuals) in Question 13 thought that water level was the most important factor in determining the beauty of a lake. Both water clarity and extent of natural shoreline were thought to be more important in determining the beauty of a lake with $35 \%$ and $35 \%$ of the respondents, respectively.

Question 14 asked the respondents how they most often judge the water level on lakes. The strong majority of the respondents use either water level in relation to the top of a dock (356 individuals, $38 \%$ ) or water level in relation to shoreline vegetation ( 310 individuals, $33 \%$ ) to judge the water level on lakes. Very few individuals use water control structures ( 18 individuals, $2 \%$ ) or in lake staff gauges ( 100 individuals, $11 \%$ ) to judge the water level of lakes. There are slight differences in the responses from different groups. The individuals from the LAKEWATCH group generally used boat docks to judge water level most often (45\%) while individuals from the Boat License group most often (34\%) used boat ramps to judge water level.

Question 16 asked the respondents to describe the shape of the lake they live on or visit. The vast majority of the respondents ( 725 individuals, $77 \%$ ) stated that the lake they live on or visit is a shallow where the bottom drops gently from the shoreline. This is not unexpected because the majority of the lakes in Florida are shallow (Hoyer et al. 2005).

| Table of Q16_lake_shape by Group |  |  |  |  |  |

Question 17 asked respondents to pick a water level based on the percentage of time a water level occurs at a lake that they prefer most. Questions 18 and 19 asked respondents to pick a water level based on the percentage of time a water level occurs at a lake where they feel the beauty and recreational use are harmed, respectively. Figure 2 and the cross table summaries below show that the vast majority of respondents to Question 17 prefer a water level above the median water level ( 854 individuals, $91 \%$ ) with $27 \%, 16 \%$, and $22 \%$ of the respondents preferring a water level where levels are at a stage equal to or less than $50 \%, 60 \%$ and $70 \%$ of the time, respectively. Questions 18 and 19 show that the majority of respondents (Question 18: 418 individuals, $52 \%$ and Question 19: 421 individuals, $53 \%$ ) felt that the beauty and recreational use of a lake are not harmed until the water levels are at a stage equal to or less than $20 \%$ to $30 \%$ of the time (Figure 2 and Cross Tables below).

Questions 20a, 20b, and 20c asked the respondents to pick the lowest water level based on the percentage of time a water level occurs at a lake that they would accept during a 2-year, 1-year and 3-month drought event. The majority of respondents (Question 20a: 362 individuals, 42\%, Question 20b: 359 individuals, $41 \%$ and Question 20c: 273 individuals, $32 \%$ ) selected a water level that occurs equal to or less than $30 \%$ to $40 \%$ of the time as the lowest water level they would accept for a 2 -year, 1-year and 3-month drought (Figure 3 and Cross Tables below).

Figure 3. Percentage of responses for Survey Questions 20a, 20b, and 20c.

Question 21 asked the survey respondents to select from 3 different water level fluctuation patterns. The majority of the respondents ( 571 individuals, $60 \%$ ) preferred a moderate increase or decrease in water level annually. A relatively large percent of the respondents (298 individuals, $32 \%$ ) preferred almost no increase or decrease in water level annually.

Question 22 asked the respondents to select one of three options that most represents their opinion on what causes water level fluctuation in the lake they live on or visit. The largest percentage of respondents (403 individuals, $43 \%$ ) felt that natural causes were the most important factor determining water level fluctuations. However, a large percentage of respondents ( 372 individuals, $39 \%$ ) also felt that both natural and man-mad causes impacted water levels.

Question 23 asked the survey respondents if governmental agencies should be involved in managing water levels. A majority of the respondents (505 individuals, 54\%) felt that government agencies should manage water level just enough to minimize flooding and low water periods, while $28 \%$ of the respondents ( 260 individuals) thought that government agencies should not manage water level in order to allow lakes to follow a natural cycle.

Question 24a, 24b and 24c asked the survey respondents to pick the lowest water level based on the percentage of time a water level occurs at a lake that they would accept to supply water to their community, another community in their county and a community in a different county. There was a wide range of responses to Questions $24 \mathrm{a}, 24 \mathrm{~b}$, and 24 c with no real dominant trend or opinion (Figure 5 and cross tables below). However, there was a trend at lower water levels for the respondents to accept lower water lake levels if it was for water use in their own community.

Figure 5. Percentage of Survey responses to Questions 24a, 24b, and 24c.

Question 26 asked the respondents if they would support or oppose the raising or lowering of water level at the lake where they live or visit, if the lake proposed water level was determined by a professional. The largest percentage of respondents (442 individuals, 47\%) supported this idea, while a smaller percentage ( 119 individuals, 13\%) opposed it.

Question 27 asked the respondents if they support or oppose the Fish and Wildlife Conservation Commission's muck removal program for lakes. A strong majority of the respondents (695 individuals, $74 \%$ ) support the muck removal program while a small percentage ( 32 individuals, $3 \%$ ) opposed it.

Question 28 asked respondents if they would or would not contact a list of seven different organizations if they had a concern about the water level in their favorite lake. Figure 6 indicates that greater than $50 \%$ of the respondents would contact their County Commission, the SWFWMD, FDEP, FFWCC, and the local Water Authority. Less than $50 \%$ of the respondents would contact their Legislators, Property Owners Association, or other organizations not listed.

Figure 6. Percentage of responses to Survey Questions 28a through 28g.

Question 29 asked the respondents how much they liked seven different lake conditions related to exposed muck shoreline plants and emergent vegetation (See Appendix I, Question 29). Figure 7 and the following Cross Tables show the percentages of respondents that liked and dislike the several lake conditions.

For Question 29a the majority of respondents somewhat (252 individuals, 27\%) or really (400 individuals, $43 \%$ ) disliked cattails growing 100 feet out from shore all the way around the lake.

For Question 29b respondents about equally like or disliked emergent plants growing in the water up to 25 feet from the shoreline.

However, for Question 29c the majority of respondents somewhat or really disliked emergent plants growing 25 to 50 feet from the shoreline.

Additionally, for Question 29d the vast majority of the respondents somewhat disliked (252 individuals, $27 \%$ ) or really disliked ( 363 individuals, $40 \%$ ) emergent plants growing in the water 50 to 100 feet from the shoreline.

For Question 29e the vast majority of the respondents somewhat disliked (238 individuals, 26\%) or really disliked (405 individuals, 45\%) exposed muck during drought conditions.

For Question 29f a majority of the respondents somewhat disliked (280 individuals, 31\%) or really disliked ( 316 individuals, $35 \%$ ) plants like cattails and willows growing out into the lake when water is low.

For Question 29g approximately $50 \%$ of the respondents somewhat dislike ( 226 individuals, $24 \%$ ) or really disliked ( 222 individuals, $24 \%$ ) new trees growing along the shoreline following a drought.

Figure 7. Summary of the percentage of Survey respondents that liked or dislike certain lake conditions related to muck, shoreline vegetation and emergent vegetation (See Appendix I Question 29)

Question 30 asked the respondents if they agreed or disagreed with 12 different statements about lake conditions (See Appendix I, Question 30). Figure 8 and the following Cross Tables show the percentages of respondents that agreed or disagreed with 12 different statements about lake conditions.

For Question 30a a majority of respondents strongly agreed (286 individuals, 31\%) or somewhat agreed ( 344 individuals, $37 \%$ ) with the statement that water level is too low when docks stick out of the water.

For Question 30b a strong majority of respondents strongly agree (510 individuals, 55\%) or somewhat agreed (238 individuals, $26 \%$ ) with the statement that over half of a lake should have open water.

For Question 30c over 50\% of the respondents somewhat disagreed (269 individuals, 29\%) or strongly disagreed (202 individuals, $22 \%$ ) with the statement that even during droughts, exposed sandy bottoms are ugly.

For Question 30d a majority of respondents strongly agreed (278 individuals, 30\%) or somewhat agreed ( 308 individuals, $33 \%$ ) with the statement that stagnant water happens when the water is too low.

For Question 30e over 50\% of the respondents strongly agreed (175 individuals, 19\%) or somewhat agreed ( 375 individuals, $40 \%$ ) with the statement that cattails and other emergent plants around a lake are attractive.

For Question 30f over $60 \%$ of the respondents strongly agreed ( 300 individuals, $34 \%$ ) or somewhat agreed ( 294 individuals, $32 \%$ ) with the statement that water levels are too low when muck is exposed for a couple of weeks.

For Question 30g over 60\% of the respondents strongly agreed (346 individuals, 37\%) or somewhat agreed (266 individuals, 29\%) to the statement that water levels are too high when it floods lawns along the lakeshore.

For Question 30h well over 80\% of the respondents strongly agreed (489 individuals, 53\%) or somewhat agreed (295 individuals, 32\%) with the statement that water level fluctuations are necessary for wetlands, wildlife and fisheries.

For Question 30i a majority but only $44 \%$ of the respondents strongly agreed ( 167 individuals, $18 \%$ ) or somewhat agreed (243 individuals, $26 \%$ ) with the statement that water control structures and dams reduce the natural beauty of lakes.

For Question 30j over 50\% of the respondents strongly agreed (244 individuals, 27\%) or somewhat agreed (261 individuals, 28\%) that water levels should be maintained to avoid odors from exposed muck.

For Question 30k 50\% of the respondents strongly agreed (184 individuals, 20\%) or somewhat agreed (281 individuals, 30\%) that when trees are flooded around the lake, water level is too high.

For Question 30L 81\% of the respondents strongly agreed (507 individuals, 55\%) or somewhat agreed (242 individuals, 26\%) that water level is too low when muck is exposed for six months or more.

Figure 8. Percentage of responses for Survey Questions 30a through 30L.

Question 32 asked the respondents if they agreed or disagreed with 8 different statements about recreational use of lakes (See Appendix I, Question 32). Figure 9 and the following Cross Tables show the percentages of respondents that agreed or disagreed with 8 different statements about recreational use of lakes.

For Question 32a, $75 \%$ of the respondents strongly agreed (418 individuals, $45 \%$ ) or somewhat agreed ( 277 individuals, $30 \%$ ) with the statement that tree stumps are a hazard when the water is low.

For Question 32b, 84\% of the respondents strongly agree (437 individuals, 47\%) or somewhat agreed (344 individuals, 37\%) with the statement that a lake with emergent and underwater plants has good fishing.

For Question 32c, a majority (59\%) of the respondents strongly agreed (283 individuals, 31\%) or somewhat agreed ( 258 individuals, $28 \%$ ) with the statement that water level should be managed to allow access to boat docks.

For Question 32d, a small majority (48\%) of the respondents strongly agreed ( 157 individuals, $17 \%$ ) or somewhat agreed ( 265 individuals, $29 \%$ ) with the statement that it is okay if a lake can only be used by canoe or kayak due to low water. However, $38 \%$ of the respondents somewhat disagreed or strongly disagreed with the statement.

For Question 32e, a majority of the respondents (66\%) strongly agreed (282 individuals, 30\%) or somewhat agreed ( 305 individuals, $33 \%$ ) with the statement that lake bottoms are damaged by the prop wash from boats during drought conditions.

For Question 32f, the respondents were somewhat split on their responses. A small majority ( $42 \%$ ) strongly agreed or somewhat agreed with the statement that low water is less objectionable if dredging is used to maintain access to open water areas. However $30 \%$ of the respondents somewhat disagreed or strongly disagreed with the statement and $28 \%$ had no opinion about the statement.

For Question 32g, 55\% of the respondents somewhat disagreed (286 individuals, 31\%) or strongly disagreed ( 221 individuals, 24\%) with the statement that a lake with emergent and underwater plants is good for swimming.

For Question 32h, the largest percentage of respondents (290 individuals, 31\%) neither agreed or disagreed with the statement that a lake with emergent and underwater plants is good for boating. However, a small majority (46\%) somewhat disagreed (271 individuals, 29\%) or strongly disagreed (155 individuals, 17\%) with the statement.

Figure 9. Percentage of responses for Survey Questions 32a through 321.

Question 33 asked the respondents to select one of five different lengths of time that would be acceptable to have a dock and/or boat ramp closed because of low water and/or growth of emergent vegetation. Figure 10 and the following Cross Tables show the percentages of respondents that selected the five different time periods.

For Question 33a, a majority of the respondents (61\%) felt that it is never acceptable (207 individuals, $24 \%$ ) or acceptable for only 2 to 4 weeks ( 321 individuals, $37 \%$ ) to have a boat ramp closed due to low water.

For Question 33b, a small majority of the respondents (57\%) felt that it is never acceptable (205 individuals, 24\%) or acceptable for only 2 to 4 weeks ( 291 individuals, $33 \%$ ) to have a dock closed due to low water.

For Question 33c, a vast majority of the respondents (77\%) felt that it is never acceptable (373 individuals, $43 \%$ ) or acceptable for only 2 to 4 weeks ( 287 individuals, $33 \%$ ) to have a public boat ramp closed due to growth of emergent vegetation.

For Question 33d, a vast majority of the respondents (75\%) felt that it is never acceptable (355 individuals, $41 \%$ ) or acceptable for only 2 to 4 weeks ( 285 individuals, $33 \%$ ) to have a dock closed due to growth of emergent vegetation.

Question 52 asked the respondents if they owned a boat and $83 \%$ ( 786 individuals) said they did own a boat. Question 53 asked how many feet of water are required to operate the boat and the median response was two feet. Question 54 asked how many days in the last month did they use their boat and the median response was 3 days.

Question 57, 58 and 59 asked the respondents their gender and race. There were $81 \%$ male and $19 \%$ female respondents to Question 57. Out of 905 respondents to Question 58, 25 said they were Hispanic or Latino. For Question 59 describing race, 896 were White, nine were Black, two were Asian, 14 were American Indian and eight were Multi-racial.

Question 60 asked the survey respondents if they worked for pay. The Cross Table below shows that $64 \%$ (593 individuals) do work for pay. Of the ones that worked for pay they listed 365 different job titles. Of the ones not working 291 were retired and there was one self proclaimed Eccentric Nutcase.

Question 61 asked the respondents how many children 12 year and younger or 12 years and older lived at their home or visit their home. Only $10 \%$ of the respondents had children younger or older than living at home and only $25 \%$ had children younger or older than 12 living at home.

## Discussion

A total of 2,563 Lake User Surveys were sent out and there were 964 returned with responses. Over $98 \%$ of the individuals responding either lived on a lake or visited a lake in the last year. The respondents ranged in age from 15 to 91 with a median age of 57. A large percentage of these respondents owned or rented lakefront property for a median of 11 years, with a median of 100 feet of frontage that had a median of 40 feet mowed. Most of these individuals owned boats $(83 \%)$ and they had used their boat a median of 3 times in the previous month. The respondents were asked to name the lake they lived on or visited and this yielded a list of 340 lakes. All of these data suggest that the survey was answered by a wide variety of individuals who are all familiar with a variety of lake types and uses.

The aesthetic and/or recreational activity conducted most by the respondents was just sitting and enjoying the lake, followed closely by fishing, wildlife watching, sight seeing, motor boating and bird watching. Each one of these aesthetic and/or recreational activities was done more than twice a month by $50 \%$ of the respondents. The three recreational activities carried out least by the respondents were sailing, jet skiing, and water skiing, with over $70 \%$ of the respondents never doing these activities.

Most individuals (89\%) thought that their lake was moderately to extremely beautiful suggesting that people are generally pleased with their lake's current condition. When asked if water level was important in determining the beauty of a lake the vast majority ( $87 \%$ ) felt it was moderately to extremely important. However, when asked to compare with other lake aspects most people thought that water clarity and extent of natural shoreline were more important than water level in determining a lake's beauty.

Most of the respondents stated that they judged the water level of the lake they use by its relation to docks ( $38 \%$ ) or shoreline vegetation ( $33 \%$ ). The vast majority of respondents ( $94 \%$ ) said they were not impacted by high water level during the last year with only $6 \%$ not able to use their lake because of high water. The only difficulties respondents had with high water was if it flooded lawns or trees during high water conditions, which relates to property damage. The vast majority of respondents $(96 \%)$ were also not impacted by low water in the last year. However, during the drought of $2000,50 \%$ of the respondents were impacted by low water. The following is a primary list, not inclusive of all conditions related to low water, that the respondents strongly felt decreased the aesthetic and recreational use of lakes:

- Cattails growing 100 feet from shore
- Emergent plants growing 50 to 100 feet from shore
- Increases in emergent and/or submersed plants that inhibit access to open water
- Plants like cattails, willows and trees growing out from shore during low water
- When the water is at the bottom of a dock
- When water is too low to access docks or boat ramps for recreational use
- Exposed tree stumps during low water
- Exposed muck during low water
- Stagnant water when water is too low

Respondents who thought low water levels impaired aesthetic and recreational use of lakes can be separated into three general groups: 1) where respondents disliked exposed muck because of aesthetics, odor and access to a lake; 2) where respondents disliked vegetation (aquatic and terrestrial) that can expand during low water and limit lake visibility and/or access of a lake for recreation; and 3) where respondents disliked the physical limitation that low water puts on lake access and recreational activities.

There were several questions in the survey regarding muck and what the respondents thought about low water exposing muck. For each question, when water was low enough to expose muck the respondents thought that lake condition was impairing the aesthetic and recreational use of the lake. When water levels were low enough to expose lake bottom (i.e., muck) the majority of respondents ( $60 \%$ to $71 \%$, depending on the individual question) thought that low water impaired the aesthetic and/or recreational use of the lake. Question 27 (support or oppose the Fish and Wildlife Conservation Commission's muck removal program for lakes) confirmed this finding with $74 \%$ of the respondents ( 695 individuals) supporting muck removal projects. These results are similar to the opinions of lake users that helped develop three different lake management plans, one each for Tsala Apopka Chain of Lakes (Hoyer et al. 1999), Citrus County, East Lake (Canfield et al. 2002), Hillsborough County, and Lake Wailes (Canfield et al. 2002), Polk County. Thus, general lake users do not appreciate lake water levels that expose muck and this condition is considered an impairment of aesthetics and/or recreational use of a lake.

There were many questions in the survey related to aquatic plants, including emergent, floatingleafed, and submersed plants. Respondents generally thought plants are essential to the "health" of a lake and that aquatic plants are needed for fish and wildlife. Most respondents (709 individuals, 78\%) considered emergent and floating leaved plants to be wetland plants and $89 \%$ (826 individuals) supported preserving wetlands. Respondents generally found no problem with emergent plants growing out to 50 feet from shore and they wished to maintain the current status of aquatic vegetation in their lake. However, when terrestrial, or aquatic plants (all types) extended past 50 feet from shore or if they interfered with recreation respondents considered this an impairment of aesthetics and/or recreational use of the lake. Supporting this finding, $79 \%$ of the survey respondents ( 735 individuals) supported some type of management of all types of shoreline vegetation (terrestrial and aquatic). Thus, any water level that supports the expansion of vegetation would be considered an impairment of the aesthetics and/or recreational use of a lake, despite respondent's desire to preserve wetlands.

There were also many questions in the survey that asked the respondents about water level in relation to the physical access to the lake for aesthetic and/or recreational activities on a lake. Survey returns indicated respondents were not that concerned about high water conditions unless the water flooded lawns and/or trees for an extended period. The majority of respondents ( $>$ $60 \%$ ) were willing to accept a "high" water level where levels are at a stage equal to or less than levels that occur $80 \%$ to $90 \%$ of the time during a 2 -year, 1 -year or 3-month flood event because these levels generally do not flood property. Respondents ( $55 \%$ to $78 \%$, depending on the question) felt that any low water situation that limits access to a lake impairs aesthetic and/or recreational use. However, for natural drought situations the majority of the respondents were willing to accept a low water level where level are at a stage equal to or less than $20 \%$ to $30 \%$ of
the time during a 2 -year, 1-year and a three-month drought event. When asked specifically what water level impaired aesthetic and/or recreational use the majority of respondents selected a low water level where level are at a stage equal to or less than $30 \%$ to $40 \%$ of the time. When asked what long-term water level they most preferred $91 \%$ of the respondent ( 854 individuals) preferred some water level above the long-term median.

## Conclusions

While people accepted the concept that some water level fluctuation is good for fish and wildlife in a lake, $60 \%$ of respondents ( 571 individuals) preferred a fluctuation pattern that incorporated a moderate increase or decrease during the year. Survey respondents understand that natural (403 individuals, $43 \%$ ), or both natural and human caused factors ( 372 individuals, 39\%) are the primary cause of water level fluctuation in their lake. Over half of the respondents ( 505 individuals, $54 \%$ ) however, felt that governmental agencies should manage water levels but just enough to minimize flooding and to prevent low water periods.

Thus, results from the Lake User Survey suggest that lake users are willing to accept water level fluctuations where water levels are at a stage that occur equal to or less than $20 \%$ of the time up to a stage that occurs equal to or less than $90 \%$ of the time. Outside of this range lake users feel that lake aesthetic and/or recreational use are impaired. However, most survey respondents preferred a moderate fluctuation pattern where water levels are at a stage that occur equal to or less than $50 \%$ of the time up to a stage that occurs equal to or less than $80 \%$ of the time

The Discussion and Conclusions of this report are primarily based on percentages of responses from the whole survey population. Most of the percentages from responses for individual question were similar (less than 10 percentage points different) among the four main user groups that were surveyed (Boat license list, Fishing license list, LAKEWATCH list and NALMS combined with FLMS list). However, there were some percentages of responses to several individual questions that differed among user groups. For example, in Question 14 a higher percentage of responses from the Boat license and Fishing license lists used boat ramps most often to judge lake water level while a higher percentage of responses from the LAKEWATCH list used docks to judge lake water level. This example may be reflective of Question 45 that shows a much larger percentage of individuals from the LAKEWATCH list own a home on a lake and they probably see their dock more than they see a boat ramp.

All of the results to individual questions are presented in Cross Tables so the reader can see any differences in responses that may be apparent among user groups, if a finer scale of analysis is needed. The raw data in an Access File are also provided on a Compact Disk attached to the back of this report if any additional finer scaled analyses are needed at a future time. However, the Discussion and Conclusions presented here should be considered the views from the whole population of Lake Users across all lake types. Depending on the individual lake, and primary lake user group there could be differences from the general patterns presented in the Conclusions. In this situation management agencies need to acknowledge there are unique situations at individual lakes and sometime strong minority views.

SWFWMD has a different nomenclature then was used in this report to describe water levels based on long-term stage records. For this report we tried to describe water levels based on the percentage of time a lake level was equal to or less than a certain percentage over time, yielding low percent numbers for low water levels. This was done to help the survey respondents better understand the survey questions. SWFWMD uses a system to describe water level in a reverse way. For example, in this report a water level that occurs equal to or less than $20 \%$ of the time is a low water level but it would be considered a P80 in District terminology. A water level that occurs equal to or less than $80 \%$ of the time is a high water level but it would be considered a P20 in District terminology. Thus for clarification of the survey conclusions, results from the Lake User Survey suggest that lake users are willing to accept water level fluctuations where water levels are at a P80 to a P10 stage. Outside of this range lake users feel that lake aesthetic and/or recreational use are impaired. However, most survey respondents preferred a moderate fluctuation pattern where water levels are at a P50 to P20 stage.

## Lake Users' Survey

1. Have you lived at a lake or visited a lake during the past year?YesNo
2. What is the name of the lake that you live at or have visited most? (If you do not live on a lake or have visited one recently, then write the name of the lake closest to your home.)
$\qquad$ Lake
3. Considering the lake that you named in question 2 , how beautiful would you rate it?Extremely beautiful
$\square$ Very beautiful
$\square$ Moderately beautiful
$\square$ Slightly beautifulNot at all beautifulNo opinion
4. How many years have you lived at or visited this lake? $\qquad$ Number of years
5. How often have you done the following lake-related activities during the past year? (Mark $\boldsymbol{\bigotimes}$ an answer for each item)

6. Were there any days during the last year when you wanted to use the lake but couldn't because of a high water level?
$\square$ No Go to Question 8
$\square$ Yes How many days did that happen to you during the following months:

Number of days Number of days

7. What did you do when high water prevented you from using the lake? (Mark $\boldsymbol{X}$ only one)
$\square$ Used another lake or waterway
$\square$ Choose another recreational activity
$\square$ Did something else with my time
8. Were there any days during the last year when you wanted to use the lake but couldn't because of a low water level?
$\square$ No Go to Question 10
$\square$ Yes How many days did that happen to you during the following months:

|  | Number of days |  |  |
| :--- | :--- | :--- | :--- |
| September, 2005 | - | March, 2005 | Number of days |
| August, 2005 | - |  | February, 2005 | -

9. What did you do when low water prevented you from using the lake? (Mark © only one)

Used another lake or waterway
$\square$ Choose another recreational activity
$\square$ Did something else with my time
10. Thinking back several years to 2000 when Florida had a severe drought, were there any days when you wanted to use the lake but couldn't because of a low water level?No, because I didn't live at or use a lake in 2000No, I was not impacted by low water
$\square$ Yes $\Rightarrow$ Which months did that happen to you during 2000?

|  | Yes | No | Don't Know | Yes | No | Don't Know |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| January | $\square$ | $\square$ | $\square$ | July | $\square$ | $\square$ |
| February | $\square$ | $\square$ | $\square$ | August | $\square$ | $\square$ |
| March | $\square$ | $\square$ | $\square$ | September | $\square$ | $\square$ |
| April | $\square$ | $\square$ | $\square$ | October | $\square$ | $\square$ |
| May | $\square$ | $\square$ | $\square$ | November | $\square$ | $\square$ |
| June | $\square$ | $\square$ | $\square$ | December | $\square$ | $\square$ |

11. What did you do in 2000 when low water prevented you from using the lake? (Mark $\boldsymbol{\otimes}$ only one)

Used another lake or waterwayChoose another recreational activityDid something else with my time
12. How important is the water level in determining the beauty or attractiveness of a lake?Extremely importantVery importantModerately importantSlightly importantNot at all importantNo opinion
13. Which one is most important in determining the beauty of a lake? (Mark $\boldsymbol{x}$ only the most important one)
$\square$ Water level
$\square$ Water clarityAmount of open waterExtent of natural shoreline$\square$ Visibility of houses along shore
14. Which of the following do you most often use to judge the water levels on lakes? (Mark $\boldsymbol{\otimes}$ only one)Water level in relation to top of docksWater level in relation to boat rampsWater level in relation to water control structuresWater level in relation to shoreline vegetationIn-lake water-level gauges (also called Staff Gages)
15. What water level do you feel decreases the scenic value of your lake?
$\square$ Top of the dock, boat ramp, etc.Middle of the dock, boat ramp, etc.Bottom of the dock, boat ramp, etc.
16. Florida lakes vary in shape. Some are shallow where the bottom drops gently from the shoreline (like a soup bowl) and others are deep where the bottom drops steeply from the shoreline (like a mixing bowl). What is the shape of the lake that is most like the one that you live at or have visited most?

Shallow where the bottom drops gently from the shorelineDeep where the bottom drops steeply from the shorelineDon't know
17. Water levels vary, with high levels during floods and low levels during droughts. Water levels also vary seasonally during the year. Over the long-term, the average water level is indicated by the $\mathbf{5 0 \%}$ water level. The $10 \%$ water level is lower because 10 percent of the time, the water is at that level or lower. On the other hand, the $\mathbf{9 0 \%}$ water level is higher because 90 percent of the time, the water is at that level or lower. Keeping in mind the shape of your lake, what is the long-term water level that you prefer most?
\(\left.$$
\begin{array}{l}\left.\begin{array}{l}\square 90 \% \\
\square 80 \%\end{array}
$$\right\} High water <br>
\square 70 \% <br>
\square 60 \% <br>
\square 50 \% \Rightarrow Long-term average <br>
\square 40 \% <br>
\square 30 \% <br>
\square 20 \% <br>

\square 10 \%\end{array}\right\}\) Low water | $\square$ Don't know |
| :--- |

18. Using the scale in question 17, what is the lowest long-term water level at which the lake's scenic beauty is harmed? $\qquad$ \%
19. What is the lowest long-term water level at which the lake's recreational use is harmed?
20. The next few questions ask about your opinion on water levels during droughts and floods. Please keep in mind that many lakes have man-made structures (for example, dams, levees, or outflow pipes to manage the water level.
a. What is the lowest level that you would accept during a 2-year

b. What is the lowest level that you would accept during a 1-year drought? . . . . . . . . . . . . . . . . . . . . . . . $\quad \square$
c. What is the lowest level that you would accept during a 3-month drought? . . . . . . . . . . . . . . . . . . . . . . . $\quad \square$ d. What is the highest level that you would accept during a 2 -year flood?
e. What is the highest level that you would accept during a 1-year flood?
f. What is the highest level that you would accept during a 3-month flood?

$\square$

21. Which water level pattern do you prefer on a lake?
$\qquad$ Large increases or decreases during the yearModerate increases or decreases during the year
$\square$ Almost no increase or decrease during the yearDon't know
22. What, in your opinion, is the cause of fluctuating water levels on the lake that you live at or have visited most?
$\square$ Mostly natural causesMostly man-made causesBoth natural and man-made causes
$\square$ Don't know
23. Do you think governmental agencies should or should not manage the water level on lakes?
$\square$ Government agencies should manage the water level to maintain a specific depth
$\square$ Government agencies should manage the water level just enough to minimize flooding and low water periods
$\square$ Government agencies should not manage the water level in order to allow lakes to follow a naturalNo opinion
24. The Southwest Florida Water Management District issues permits for cities and individuals to pump water from wells to supply households and businesses. Pumping groundwater can lower water levels in lakes. Given this background, please answer the following questions.
Lowest water ---------------------------------Highest water

Don't

a. What is the lowest level that you would accept over the long-term in order to provide water for your community?
b. What is the lowest level that you would accept over the long-term in order to provide water for another community in your county? . . . . . . . .
c. What is the lowest level that you would accept over the long-term in order to provide water for people in another county? .................. $\square \quad \square \quad \square \quad \square \quad \square \quad \square \quad \square \quad \square \quad \square \quad \square$
25. Suppose the lake bottom were exposed by drought. Would you support or oppose an additional amount being exposed by people pumping nearby well-water?
a. For household use
b. For use on the lawn or gardens.

26. If raising and lowering lake water to a level determined by professionals was possible at the lake where you live or visit, would you support or oppose their recommendation?
$\square$ Support professionals' recommendations on water levelNeither support nor oppose professionals' recommendations on water level
$\square$ Oppose professionals' recommendations on water levelDon't know
27. Do you support or oppose the Fish and Wildlife Conservation Commission's muck removal program for lakes?

Support muck removal programsNeither support nor oppose muck removal programsOppose muck removal programs
28. If you have a concern about the water level in your favorite lake, who would you contact? (Mark 区 an answer for each item)

| County Commission | $\square \mathrm{Yes}$ | $\square$ No |
| :---: | :---: | :---: |
| Southwest Florida Water Management District | $\square$ Yes | $\square$ No |
| Florida Department of Environmental Protection | $\square$ Yes | No |
| Florida Fish and Wildlife Conservation Commission | $\square \mathrm{Yes}$ | No |
| State Legislator | $\square$ Yes | $\square$ No |
| Local water authority | $\square$ Yes | $\square$ No |
| Property owners association | $\square$ Yes | $\square$ No |
| Other organization | $\square$ Yes | $\square$ No |

The next few questions ask your opinion about the aesthetics or scenic value of lakes. 29. Please rate how much you like or dislike the following conditions for lakes.
a. Cattails growing $\mathbf{1 0 0}$ feet out from shore all of the way around the lake $\qquad$
Neither

g. New trees growing along the shoreline following a drought that block the view of the lake

30. Please indicate your agreement or disagreement with the following statements.

Neither

c. Even during droughts, exposed sandy bottoms are ugly
d. Stagnant water happens when the water is too low $\qquad$

Neither around lake shores are attractive.
f. Water levels are too low when muck is exposed for a couple of weeks
.
g. Water levels are too high when it floods lawns along the lakeshore
h. Water level fluctuations are necessary for wetlands, wildlife and fisheries .
i. Water control structures and dams reduce the natural beauty of lakes
j. Water levels should be maintained to avoid odors from exposed muck
k. When trees around a lake are flooded, the water is too high

1. Water levels are too low when muck is exposed for 6 months or more $\qquad$
$\square$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

. . . .
```

f. Low water is less objectionable if dredging is used to maintain access to open water for boaters . . . . . . . . . . . . .
g. A lake with emergent and underwater plants is good for swimming . . . . . . . .
h. A lake with emergent and underwater plants is good for boating . . . . . . . . . .

33. Please answer the following questions about access to docks and boat ramps.

|  |  |  | Closed for |  |
| :---: | :---: | :--- | :---: | :---: |
| Never | Closed for | Closed for | Closed for | more than |
| closed | $2-4$ weeks | $2-3$ months | $4-6$ months | 6 months |

a. What amount of time that a public boat
ramp is closed due to low water would you consider acceptable? . . . . . . . . . . . .
b. What amount of time that a dock is closed due to low water would you consider acceptable? $\qquad$
c. What amount of time that a public boat ramp is closed due to growth of emergent vegetation would you consider acceptable? . . . . . . . . . . . . . . . .
d. What amount of time that a dock is closed due to growth of underwater plants would you consider acceptable?
34. Are you aware that there is a recreational standard for the water level in Florida's lakes?YesNo
The next few questions ask your opinion about emergent and underwater plants at lakes.
35. Do you think emergent plants (e.g., Cattails) and floating plants (e.g., Lilly pads) are wetland vegetation?YesNo
36. Do you support or oppose preserving wetlands?Support preserving wetlandsNeither support nor oppose preserving wetlandsOppose preserving wetlands
$\square$ Don't know

37．Do you support or oppose managing aquatic plants along the shoreline of lakes？
Support managing aquatic plantsNeither support nor oppose managing aquatic plantsOppose managing aquatic plantsDon＇t know

38．Of the following which do you consider to be good for a lake？（Mark ⿴囗⿱一一（Mly one）Increasing underwater plantsMaintaining underwater plants
Decreasing underwater plantsDon＇t know
39．If low water resulted in an increase in underwater plants that limit your access to open water boating， would you consider this impaired aesthetics or recreation？Both impaired aesthetics and recreationImpaired aesthetics onlyImpaired recreation onlyNeither aesthetics nor recreation is impairedDon＇t know
40．Does it matter to you whether an underwater plant is a native to Florida or introduced from outside the state？YesNo

## Don＇t know

41．If Hydrilla（an invasive plant introduced into Florida）was ranked by biologists as the best underwater plant for fish and wildlife would you accept this plant in your lake？YesNoDon＇t know
42．If water was high enough to allow fish to survive and attract large numbers of wading birds，but not to support fishing on the lake would this be acceptable？YesNoDon＇t know
43. If low water would benefit a single endangered species at the expense of other plant and animals, would you support or oppose lower water levels?
$\qquad$ Support
$\square$ Neither support nor oppose
$\square$ Oppose
Don't know

Finally, we would like to ask a few questions for statistical purposes.
45. Do you own or rent property on a lake?Own
Rent
$\square$ Neither own nor rent $\Rightarrow$ Skip to question 50.
46. How many feet of lakeshore frontage do you have?
$\qquad$ Feet of frontage
47. Of the lakeshore frontage, how many feet of vegetation have been cleared or mowed?
$\qquad$ Feet cleared or mowed
48. Do you have a dock?Yes $\square$ No
49. If Yes, how deep is the water at the end of dock currently?There is no waterLess than 1 foot
$\square$ 1-2 feet
$\square$ 3-4 feet
$\square$ Over 4 feet
$\square$ Don't know
50. Do you have a boat ramp or access to one on your lake?Yes, concrete rampYes, sand/dirt rampNo
51. If Yes, has it ever been unusable because of low water?Yes$\square$ No
52. Do you have a boat?Yes$\square$ No $\Rightarrow$
Skip to question 56.
53. If Yes, how many feet of water do you need to operate your boat?
$\qquad$ Feet
54. How many days did you use your boat on a lake during the last month?
$\qquad$ Number of days
55. How many people, including yourself, usually ride in the boat?
$\qquad$ Number of people
56. What year were you born?
57. What is your gender?Male Female
58. Are you Hispanic or Latino? $\quad \square$ Yes No
59. What is your race? (Mark all that apply)White
$\square$ Black
$\square$ Asian
American Indian
$\square$ Multi-racial or other (please specify)
60. Do you work for pay?
$\square$ Yes $\Rightarrow$ If Yes, what kind of work do you do?
$\square$ No
If No, are you looking for a job or are you retired, a student, or a homemaker?
$\square$ Looking for workRetiredStudentHomemaker
$\square$ Other $\qquad$
61. How many children or grandchildren ...
a. Live in your home?
b. Visit your home?
$\qquad$
$\qquad$

Thank you for helping.
